Various kinds of tendon prostheses have been used to date in reconstructive surgery for tendon damage. The prostheses are required to be soft and supple and to have good tenogenic properties. If the prosthesis is so supple as to be torn by the sutures themselves, the prosthesis is unsuitable for treating tendon ruptures or defective tendon conditions requiring surgical reconstruction. It is an object of this invention to provide a prosthesis for reconstruction of a ruptured tendon which has excellent flexibility, and which supple after implantation.Q: How to dynamically populate an Object and map it to an array of objects I have a lineItem array (in the format below) that I would like to map to an array of lineItem objects with the properties' from the JSON in lineItem. lineItem = { "id":1, "type": "strip", "name": "blah", "descr": "blah", "from": "1", "to": "2", "weight": "25", "price": "12.5", "total": "40" } So basically I need to dynamically populate an object (lineItem) that will be populated with the values from my data.
